

LITEPAPER V1.2

ROBINHOOD CHAIN - TESTNET FIRST

A FUEL-powered DeFi protocol for recurring ETH and cbBTC rewards, with FUEL, MORE and PAMP buy-and-burn pools.

EXPERIMENTAL - UNAUDITED - MOCK ASSET ALPHA

September 2026 | Economics specification and testnet status

Release status

WHAT V1.2 REPRESENTS

This revision reflects the current source and public accelerated testnet. Mainnet-fork swap tests are separate experiments; no real market swap is live on the public testnet.

PUBLIC TESTNET ALPHA

- Robinhood Chain Testnet, chain ID 46630.
- Mock FUEL, MORE, PAMP and cbBTC conversion paths.
- Public wallet-connected site on GitHub Pages.
- Accelerated minute-based payout and position clocks.

PRODUCTION TARGET

- Day-based positions and payout cycles.
- Reliable live FUEL fee pricing.
- Protected FUEL, MORE, PAMP and cbBTC swaps.
- Audit and independent review before real assets.

V1.2 ECONOMICS

- Forge fees: 41% rewards, 33% FUEL, 20% MORE, 5% PAMP, 1% development.
- Foundry mints separately burn 100M FUEL and charge a bounded ETH fee.
- Of each Foundry mint fee, 99% funds cbBTC rewards and 1% goes to development.
- Burn-engine daily drip starts at 1%; its owner can set 1%-10%.
- Settlement reserves 0.25% per payout pool; burn execution pays 1.5% in ETH.
- Cycle schedules share a 16:00:00 UTC launch anchor.

SHAREABLE, NOT A SAFETY GUARANTEE

The alpha is designed for public testing with wallets that hold no real assets. The protocol is unaudited. Test coverage, testnet operation and a polished interface do not prove that production contracts are safe.

Fuel Forge at a glance

ONE ASSET, TRANSFERABLE POSITIONS, RECURRING POOLS

Fuel Forge adds utility to FUEL without creating a new native token. Users lock FUEL, optionally burn more FUEL to increase Forge Power, and compete for recurring externally funded rewards.

8-1,000d

STAKE RANGE

Any whole-day term

5.0x

MAXIMUM POWER

4

SUPPORT

Fund rewards and buy-and-burn

NO NATIVE FORGE TOKEN

- FUEL is the principal asset users stake and burn.
- Forge Power determines each position's share of ETH rewards and transfers with its NFT.
- ETH and cbBTC are externally funded reward assets.
- FUEL, MORE and PAMP receive recurring buy-and-burn support from position fees.
- Position NFTs transfer the full economic position without resetting its terms.

Forge Power

LONGER PAYS BETTER + BURN PAYS BETTER

Every normal stake becomes a Forge Position NFT. Principal, initial power, creation time and maturity are fixed at creation. A position cannot be modified or withdrawn early.

FORMULA

$$\text{Power} = \text{Stake} + \text{Duration Bonus} + \text{Burned FUEL}$$

Maximum: 1x base + 1x duration + 3x burn = 5x total

DURATION BONUS

Linear from +0% at 8 days to +100% at 1,000 days.

8 days	0%
88 days	8.1%
365 days	36.0%
730 days	72.8%
1,000 days	100%

BURN BONUS

Burned FUEL adds power 1:1 and is capped at 3x the stake.

0x stake burned	+0%
1x stake burned	+100%
2x stake burned	+200%
3x stake burned	+300% MAX

EXAMPLE

100M FUEL staked for 1,000 days plus 300M FUEL burned:

500M FORGE POWER

100M base + 100M duration bonus + 300M burn bonus. The 300M burn is permanent. The 100M principal follows the maturity and late-finalization rules.

Recurring reward cycles

ELIGIBILITY FREEZES AT THE SCHEDULED TIMESTAMP

The payout clocks are global. Any active position with positive Forge Power at a scheduled close participates, regardless of its chosen term.

Cycle	Asset	Share of 41% bucket	Settlement
8 days	ETH	32%	Batched public trigger
28 days	ETH	27%	Batched public trigger
88 days	ETH	21%	Batched public trigger
288 days - Foundry	cbBTC	20%	Public trigger

SETTLEMENT RULES

- Eligibility is evaluated at the scheduled deadline, even if settlement occurs later.
- A position created or closed at the exact deadline is excluded from that closing cycle.
- Each pool reserves 0.25% total for public settlement execution.
- For 8/28/88-day pools, the 0.25% budget is shared among callers processing bounded batches.
- Rewards are pull-based, follow NFT ownership and never expire.
- After all eligible claims, indivisible rounding dust rolls into the active cycle.

CLOCK ANCHOR

16:00:00 UTC

Launch and every future 8/28/88/288-day deadline are derived from this fixed UTC anchor. Delayed settlement cannot move future clocks or capture later-cycle funding.

Position NFTs & maturity

TRANSFERABLE POSITIONS, NO EARLY EXIT

Each stake is represented by a transferable NFT. Ownership controls the remaining principal and every unclaimed reward associated with that position.

LATE-CLAIM TIMELINE

OWNER ACTIONS

- Before maturity: no withdrawal.
- Maturity through day 7: Withdraw returns 100% of remaining principal.
- Day 7 through day 14: Withdraw returns the linearly decayed amount and burns the rest.
- Withdrawing closes and burns the position NFT while preserving past reward rights for its final owner.

PERMISSIONLESS FINALIZATION

At day 14 the economic value is zero. The contract cannot execute by itself, so any wallet or automation may call Finalize expired position.

Finalization sends all remaining principal to the permanent burn address, closes the NFT and records its final owner so earlier rewards remain claimable.

DECAY AND TRANSFERS

- Power remains unchanged during the first seven late days, then decays linearly for seven days.
- Lower power automatically reduces that position's share and increases other positions' relative shares.
- Previously allocated rewards are untouched by later decay or finalization.
- Transfers do not reset principal, power, maturity, decay or claim history.

The 288-Day Foundry

PERMANENT FUEL BURN FOR AN EQUAL SHARE OF CBBTC

The Foundry is separate from normal staking. Each NFT permanently burns 100M FUEL and pays a bounded ETH mint fee. NFTs in one 288-day cycle share its cbBTC pool equally.

100M FUEL

BURN PER NFT

+ bounded ETH mint fee

cbBTC

REWARD ASSET

Accumulated through cycle

1 NFT = 1

EQUAL SHARE

Unlimited per wallet

HOW IT WORKS

1

MINT

Burn 100M FUEL and pay the separate ETH fee.

2

ACCUMULATE

Forge fees and Foundry mint fees fund cbBTC.

3

SETTLE

At cycle close, a caller receives 0.25%.

4

CLAIM

Each NFT shares equally. Claims do not expire.

FOUNDRY MINT FEE: CURRENT FAST TEST

0.005 test ETH

What you pay: 100M mock FUEL burned plus this ETH fee for each NFT. Wallet gas is extra.

How it is priced: 0.5% of the quoted ETH value of 100M FUEL, with a 0.001 ETH floor and 0.01 ETH cap.

Why 0.005 now: the test oracle fixes 100M mock FUEL at 1 test ETH; 0.5% of 1 ETH is 0.005 ETH.

Where it goes: 1% to development (0.00005 ETH), 99% to mock cbBTC rewards (0.00495 ETH).

AFTER SETTLEMENT

Foundry NFTs never earn from a later cycle. They remain transferable and carry any unclaimed reward for their original cycle. Once all NFTs have claimed, smallest-unit rounding dust rolls into the active Foundry cycle.

The public testnet uses mock cbBTC and a fixed test price. A future real-asset fee would use a live FUEL quote; real ETH-to-cbBTC conversion has been tested only on a local mainnet fork.

Protocol fees & buy-and-burn

TWO FEE PATHS, THREE BURN POOLS

Creating a normal position requires an ETH fee based only on the ETH market value of staked FUEL. Burned FUEL and duration do not increase the fee.

FEE RULE

0.5% of staked FUEL value in ETH

MIN 0.001 ETH | MAX 0.01 ETH

EVERY 1 ETH OF FORGE POSITION FEES

41%

REWARDS

33%

FUEL

20%

MORE

5%

PAMP

1%

DEV

BURN ENGINES

- FUEL, MORE and PAMP pools start at a 1% daily drip; the owner can set 1%-10%.
- The daily rate is spread over 144 ten-minute slots (10 seconds in the fast test).
- Missed intervals remain executable rather than disappearing.
- Any wallet may execute; 1.5% of the gross amount pays that caller in ETH.
- Completed, unexecuted slots keep the rate active when they elapsed.
- Only the remaining 98.5% is used to buy tokens and send them to the burn address.

FOUNDRY FEES: a separate 0.001-0.01 ETH mint fee sends 1% to development and 99% to the cbBTC reward pool.

Trust model & implementation

FIXED ECONOMICS, EXPLICIT TESTNET LIMITS

HARD-LOCKED ECONOMICS

- 8-1,000-day stake range and power formula.
- Forge fee route: 41 / 33 / 20 / 5 / 1.
- 32 / 27 / 21 / 20 reward weighting.
- 8 / 28 / 88 / 288-day clocks at 16:00 UTC.
- 100M FUEL Foundry burn; ETH mint fee is bounded.
- Late decay, no early exit and irreversible burns.

PRINCIPAL & REWARDS

- No developer path to withdraw user principal or rewards.
- Pull claims do not expire.
- Failed atomic settlement leaves the transaction reverted for retry.
- Permissionless expiration finalization preserves past reward ownership.
- Rounding dust is conserved through rollover.

PRICING AND SWAPS

The public testnet uses fixed mock FUEL pricing and deterministic mock conversions; it does not trade on Robinhood mainnet. A local mainnet fork has exercised protected swaps for FUEL, MORE and PAMP and ETH-to-cbBTC conversion. The fork is experimental, and live price references, liquidity handling and external review require more work before a real-asset deployment.

The owner can adjust each burn pool's daily drip within 1%-10%. Fee allocations and the 1.5% caller share are set in the current contracts.

TESTING STATUS

- Unit and fuzz tests cover formulas, timing, claims and access boundaries.
- Integrated tests exercise routing, Foundry fees and all three burn paths.
- Stateful invariants verify conservation through repeated fee routing.
- The protocol is unaudited. Public testnet use is for testing, not proof of safety.

Risks & test participation

EXPERIMENTAL, UNAUDITED, HIGH RISK

The public alpha uses valueless test assets. A future real-asset deployment could cause partial or total loss. Review these risks before interacting with any version of Fuel Forge.

NO EXPECTATION OF PROFIT

Rewards depend on protocol activity and revenue. They are not fixed yield, APY or a guarantee of appreciation.

ASSETS CAN BECOME WORTHLESS

FUEL, MORE, PAMP, ETH, cbBTC and both NFT types may lose significant value. Buy-and-burn does not guarantee price support.

SMART-CONTRACT AND MARKET RISK

Bugs, exploits, thin liquidity, failed integrations, oracle problems and economic flaws can cause loss.

LOCKS, BURNS AND PRINCIPAL LOSS

There is no early withdrawal. Voluntary and Foundry burns are permanent. Late decay can destroy all principal.

TESTNET IS NOT A SAFETY GUARANTEE

Passing tests and public testnet availability do not guarantee correct or safe production behavior.

PUBLIC ALPHA: USE A NEW TEST-ONLY WALLET AND TEST ETH

Never paste a private key, seed phrase or keystore password into a website, chat or issue report.
